Today we celebrate 75 years since the first "blue baby" surgery by Alfred Blalock, with Helen Taussig and Vivien Thomas on November 29, 1944.

The child was 15-month-old, Eileen Saxon, the surgery was a success and she went home after 3 months. Unfortunately her cyanotic episodes returned and 2 days before her 2nd birthday, she underwent another operation, she passed away 5 days later.

Now known as the BT or BTT shunt, the surgery was a success and really the start of [#CHD](#) surgery. We have come a long way since then, with an almost 95% survival rate into adulthood now.

Between 1947 and 1953 Blalock and Taussig were nominated for Nobel Prizes in either Physiology or Medicine. They later received the Lasker Award in 1954. Unfortunately, Thomas' contribution wasn't recognized until much later, the story being made into an excellent feature film by HBO called 'Something the Lord Made'.
